

I2F MEDIA PRODUCTS

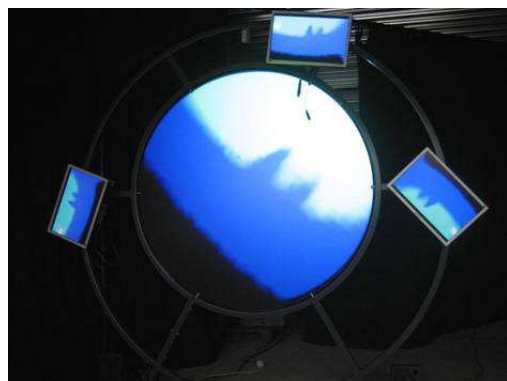

Inter2Face presents the broad scope of its software family in diverse ways.

Walking past the **digital wall** in hall 12 you will notice we approach digital signage as an interactive digital poster.

In our comprehensive showcase **I2F MediaWheel** both content and a variety of hardware are synchronized and controlled by our software.

Some unique features of I2F Media Products are:

- One and the same software package, **I2F MediaBrick**, can handle both HD media reproduction and a thorough control of any hardware involved (sound, lights, projectors, cameras, motors etc.).
- Taking information from both content and hardware, I2F MediaBrick is able to link actions or events (lights, sounds ...) to a specific frame or fragment in the content.
- **New:** "Goto clip position" feature: the software can jump seamlessly from one frame in a clip to another, e.g. after interaction with a push button.

Come by and get the latest I2F MediaBrick demo version on a USB-stick.

I2F Media Products operate on standard hardware.

NEW! I2F MEDIABOX: In order to serve better those clients who want the best suitable hardware for their needs, even à la carte, we have designed a box which combines high performance components with a very functional design, operating 365 days a year in an unmanned way.

There are two different formats: **I2F MediaBox microATX** and **I2F MediaBox miniITX**.
